Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

ALL OF YOU THERE IN DC SIMPLY CANNOT PULL THE RUG OUT FROM UNDER EVERY CITIZEN OF OUR NATION AND ROB US OF OUR FREEDOMS, A LA MAO TSE TUNG!

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. Re: Preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52

Please do not move to the open Internet policy. In fact, please leave it alone. We do not need more government intervention.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive and the free market is working well. Phone, cable and satellite companies are competing to win customers, and now wireless companies have entered into the competition. I have many choices. If government controlled the internet, there would be no choice.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and almost certainly be economically impractical. It seems designed to engineer and economic downfall of the internet which would then require a government "bailout", caused not because the industry was unable to sustain itself, but because it could not survive foolish regulations.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is bringing light into the darkest areas of the world. It is the most powerful technological tool combatting totalitarianism and oppression ... a role once played by radio, and later television, until oppressive governments learned to seize control of electronic communications. The internet will soon have been responsible for the overturn of radical Islamic leadership in Iran, and of other totalitarian regimes in Africa, Asia and the Americas.

Former United States Supreme Court Justice Oliver Wendell Holmes argued eloquently for free speech in *Abrams v. United States*: "Persecution for the expression of opinions seems to me perfectly logical. If you have no doubt of your premises or your power and want a certain result with all your heart you naturally express your wishes in law and sweep away all opposition...But when men have realized that time has upset many fighting faiths, they may come to believe even more than they believe the very foundations of their own conduct that the ultimate good desired is better reached by free trade in ideas...that the best test of truth is the power of the thought to get itself accepted in the competition of the market, and that truth is the only ground upon which their wishes safely can be carried out. That at any rate is the theory of our Constitution."

Holmes later termed free speech the "reverberating clang of ideas in the marketplace." There is no concept more essential to individual freedom and liberty ... in Africa, Afghanistan or America.

The first act of any modern dictator--Nazis and Facists and Maoists and other "Freedom Fighters", that is, those who fight against Freedom--has been to seize control of electronic communications technology.

Taxes and taxpayer subsidies on the internet would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Today a word means the opposite of what you find in the dictionary. Was is Peace, Freedom is Control by the Government that is meant to Serve the citizens of this country. Transparent government is a secretive government. Fairness is preference given to one political ideal over another. The government needs to do what it does best. When I figure out what that is I will let you know. Until then hands off!

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Instead, the FCC should be utilizing its powers to push full steam ahead with facilitating extension of Internet access to unserved and undeserved rural areas of our vast nation. The digital divide includes the U.S. hinterlands.

Thank you for your serious consideration of my concerns.

Sincerely,

Gregory Lane Hunter

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The first amendment to the U.S. Constitution states that Congress shall make no law that abridges the freedom of speech. I should think that the spirit of this prohibition would extend to the Executive branch of Government so that no the Executive branch would not act to control or abridge the freedom of speech expressed by and through the internet.

Adherence to and respect for the Constitution is absolutely essential for the survival and vitality of this great country. Any action by government that asserts selective control of the freedom of speech and/or of the press would be in violation of the Constitution and be a step toward tyranny.

I firmly oppose any governmental control of the the use of the internet by means of so-called "net neutrality" or whatever similar term or idea.

Such action will inevitably lead to dire consequences. As a student of history and trends, the American spirit will not tolerate further moves toward a totalitarian state. This is not Germany of the 1930s, post-Tzarist Russia, Pol Pot Cambodia (or a long list of consistently failed socialist “utopias.” A line has been drawn and already crossed over: NOT IN OUR COUNTRY, YOU DON'T!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

In addition, Washington has proven itself to be financially irresponsible, wasteful and wantonly destructive. In regard to laws, Washington has shown itself to be willingly ignorant of, incapable of following, and unabashedly defiant of the laws they themselves create. They have also shown a complete disregard or no knowledge or understanding of the burdens that these laws have on the taxpaying citizens and businesses of the US. Washington must have no more power than what it is granted by the US Constitution. Currently, Washington has abused its power and should be treated as a domestic enemy of the United States for its treasonous acts of willful destruction of the US economy, (cap and trade, carbon tax designed to cripple and steal from an economy that is trillions of dollars in debt) its takeover of private businesses, (auto industry, banking industry, health care industry, insurance industry) over-taxation of its citizens and businesses. No more should the people of the US be victims of intimidation, over-regulation, corruption of government, over-taxation and the Washington “let them eat cake” mentality of corrupt over-paid multi-millionaires who have no clue as to what it is really like to struggle in America today.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Once again, the government is trying to intervene in the private sector and reduce the autonomy that allows free market enterprise to thrive, create jobs and provide the engine that allows that government to exist. You government officials forget, far too often, who you work for. It is MY money that pays your salary and so yes, I have a say in how you conduct business. It is not the other way around. The government does not provide me with anything that I do not pay for in one way or another. You work for me, millions of other American people and American companies and if you don't quit inserting yourself in places where you don't belong WE WILL FIRE YOU!

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

As an American, I do not want the government taking over the internet and filtering what it approves and disapproves according to the left wing liberal socialist agenda. In the future I do not want to see America turn out how China uses its government to filter out Christian websites. This would completely abolish our American freedom of speech, religion, and separation of church and state.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive and that leads to innovation. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. This proposal will cause businesses that are currently thriving on the Internet uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity, and cause more job losses. I have a friend who creates web ads that would not have a job because of the intrusion of government regulations that these investments would no longer make economic sense.

Transforming the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Constitution does not allow the Commission to require these intrusive regulatory changes.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, I ask you to reject new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As mentioned in the first sentence of this comment, any attempt by congress or any bureaucracy to limit our free speech rights is unconstitutional in every respect and is not conducive to freedom of any sort, rather it smacks of communism and fascism in the vein of Lenin, Mao, Stalin, Hitler and Mussolini. Any further attempt to foist such a policy upon the American people will only serve to lessen or eliminate the already dangerously low trust the public has in this administration. Once the elections are held in November 2010, if this policy has been implemented, the President will be impeached shortly thereafter!!!!

Government regulation in general breeds inefficiency. It adds an extra hurdle to business trying to inovate and thrive. The internet is one of the most vibrant and expressive business undertakings that have ever graced the planet. It facilitates the flow of ideas and cross references oportunities and technologies in ways that have accellerated the rate of advance of civilization and allowed people who never had an inkling of what the rest of the world was like a window to view that world and a wind of change for the better.

"Net nueutrality" will shutter that window by letting a third party decide what is "right" and "allowable" for the world to view. It will still the winds that fan the flame of inovation. Our nation and the planet are on the verge of some very momentus cliffs from global warming to over population. Is now a good time to shut down the free flow of information and stifle the minds that could find the answers to fix these problems??? I think that that would be disaterous.

I ask you to vote down the new "net neutrality" mandates and let the net continue to flourish.

You guys are just putting another mask on the face of your insidious desire to control the freedoms of American citizens. Are you so insecure that you need to hogtie the hands of great innovators and the American spirit of advancing technologies? It is so obvious to the American people that the same motivation in private industry that creates greedy leaders is the same motivation in our government. You are no better than Bernie Maddoff.

Get your stinky, bloody hands off our freedoms!

It is obviously a power grab on your part to tax the living daylights out of the people YOU should be serving. This is not service, its slavery.

NO! To your ideas, your desires, your control, your impotent and self-serving so-called leadership...get your hands off!

STOP! Molesting of our freedoms. Let private industry fail or succeed. Let capitalism do what it has successfully done for over 200 years. Grow! Innovate! Discover! Advance!

The government has never ever shown the ability to do what private industry and citizens have done in advancing technologies--even technologies that feed other nations!! The government only rides on the backs of private industry and takes the credit.

Under your restrictive meddling innovation will die. What are you going to do when the very technologies you feed off of die and you have nothing to control, nothing to tax? BACK OFF! You don't know how to run anything all you do is write laws to your advantage.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Sincerely,

Anne Marie Jones

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

The use of the internet is key to my children doing school projects and their homework. It is also the way I purchase needed items for my home and family. I also keep in touch with my family via e-mail as they all live far away. We use the internet to print maps of destinations in and out of the area and find places and prices for food, clothes, home furnishings, toys and cars. The internet belongs in the hands of private American companies that know how to run businesses NOT the government...ever.

We have had a Czar of this department and a Czar of that department, which has only resulted in more government control. As I was growing up, my parents constantly educated me about the "free" country in which we were living, a democratic country where everyone had a voice. In today's times it appears that we are no longer democratic, but rather socialistic because the government is controlling everything. The spirit of free enterprise is something of the past. Here comes the Internet Czar!!!

Such a transformation of the Internet into a government-controlled public utility is a MISTAKE! It is unnecessary, and the ONLY reason the government would take control over the Internet would be to TAX it! The American people are already being taxed into poverty. The FCC should set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

The government has never run anything well, economically, or efficiently. And, ever since the election of FDR to the presidency we have had more and more unconstitutional things proposed, and, in some cases, even passed illegally into law by socialists in the government. Our country's founders knew that we need less government, not more, and that we need to keep a tight rein on what government we do have. They put that into our Constitution--the law of our land, but that hasn't stopped the socialists from trampling all over it. Stop messing with my country and my Constitution! If you don't like my country--LEAVE! I will help you pack!

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Senators, Congressmen, Judges, Executive, HANDS OFF THE INTERNET! You can't even manage correctly the federal budgets, schools, IRS, wars, roads, health care and banks.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

As someone who accesses the Internet for reasons, professional and private, each and every day, I am interested in preserving the features that have made the Internet the excellent source of knowledge and communication that it has become since the days when it was a Department of Defense project out of UCLA. Therefore, I wish to urge the Federal Communications Commission to maintain the decentralized, free market-oriented, non-governmentally-regulated nature and character of the Internet and to prevent the so-called "open Internet" and "net neutrality" proponents from destroying a great American invention. GN Docket No. 09-191, WC Docket No. 07-52:

At present, the Internet is a highly competitive realm that has already vastly augmented customer options to viewing television (like the Hulu website), listening to Internet radio, participating in electoral politics (fund-raising, expressing political perspectives, communicating with fellow travelers), conducting research for school and business, personal finance & paying bills, engaging in commerce through on-line purchasing (which I did to a considerable extent during the recently concluded Christmas season). Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

First, let's get one thing clear: Our President said (while recently in China) he is for an open and free of censorship internet....his lips say one thing and his actions do the opposite!!

Second, why don't you start giving these Bills a name that fits what they really are: there's is nothing "open" or "neutral" about this bill.

Frankly, I can not believe we are in ANOTHER position to defend ANOTHER government take-over. What part of OUR Consitution states that government must think for us and control all of our actions? I simply can't find this anywhere in OUR Constitution. If our current members of congress truly want this, then move to socialistic country....there's a few to choose from.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. Do you plan on "sneaking" in a rule stating "should this pass, it will never be able to be challenged by another congress..."? I don't want to give you any ideas, but this current congress is on a roll to government take-overs.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

I only read up to page 61....and it doesn't pass the smell test. Why does our government think their involvement can/will improve things? At this moment, I cannot think of one example (there must be at least one!) where the governments "rules and regulations" improve the subject matter. As of now, we have competition to turn to...we still have a monopoly with Comcast (I don't have a choice at this time). Please don't muddy the waters any more.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please leave the internet alone and don't mess things up for the public!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Whatever happened to government "by the people" .....not government by the government!!!

Thank you for reviewing my stand on this issue.

As an American with a longstanding belief that government is for the people (rather than the people being for government), I am submitting the following comment regarding preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. As a former legislator who was responsible for issues involving business and commerce, I find it highly irregular that a non-elected, appointed commission is trying to usurp the legislative authority of Congress is regulation of interstate and international commerce.

The Internet is also the means of communications for many people of all political persuasions. It is an essential means of communication for many people who live in rural areas that have limited telephone and television service (e.g., the Navajo Nation). Traditional telephone and traditional cable TV companies have been locked in an intense struggle to win customers. Wireless communications is rapidly becoming another viable alternative to wired broadband connections.

The crux of the issue is that if a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Williamsburg, Virginia 23185

I submit the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercises control over the Internet, there will be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty, create litigation risks, and discourage entrepreneurial efforts by lowering the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former Socialist White House adviser Susan Crawford.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down the fascist path of yet another government controlled component of industry.

I fear that the Commission is now contemplating Internet content restrictions inhibiting my own and others First Amendment rights to free expression and access to the means of publishing our thoughts without fear of governmental censorship, such as suggested by paragraph 77 of the NPRM. It is not the proper function of the Commission to control which competing interests should be prioritized by governmental fiat.

The anti-free speech advocates of “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their footless claims should be rejected as left-wing political polemical. There is no evidence of discriminatory or anti-competitive behavior. Without the ipse dixit claims of the proponents, there is no rational basis for imposing new regulations that will necessarily have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American and a user of the Internet, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The proposed "Open internet" rules if implemented will limit the existing highly evolved competitive nature of this incredible resource while at the same time it will impose unnecessary and unwarranted government interference on its use by citizens and businesses alike.

The "public utility" model would inevitably bring government control and politicization along with government ownership. Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress. The FCC should not on its own set into motion regulatory changes that will force us down this path.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

Concerning the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The freedoms the current internet situation affords both in this country and internationally are too valuable for anyone to consider a so-called "Open Internet" plan.

As I see it, "Open Internet" is a means of initializing controls that would so limit investment returns that it would cause a reduction of financial and inventive investments which would cripple both internet freedoms and developmental progress.

This crippling scenario would also provide the means for yet another government take over disguised as a government "rescue" funded by more taxpayer money.

Such a transformation of the Internet into a government-controlled public utility is an open door for politicizing, power grabbing and criminal favoritism.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

More and more, this administration is beginning to sound like a combination of the novels entitled '1984' and 'Animal Farm', both by George Orwell. Freedom of the Internet equates to freedom of speech and freedom of the press, both of which are protected by the Constitution of the United States.

Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change. The internet is not a government entity and should be left alone. The government can not possibly take care of the internet. Proof being when they allowed our veterans social security numbers to be stolen from their "secure" hands. This is an issue that should be debated in Congress, the legitimately elected legislative branch of government. Better yet by the citizens who use the internet. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

This is just another attempt of our government to control the lives of its citizens without concern or interest if what we really want or how we really feel about these serious issues. I urge deep, open discussion on these far-reaching issues and listen to this country's citizens!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

To make it clear. Mr. McChesney, nor Susan Crawford are not the caliber nor do they have the ethics to represent me in this matter or any other matter. Let the government involvement already authorized, often in violation of the Constitution of the United States of America, be proven effective and workable before jumping to new areas. Those unhappy with doing this, always have the option of leaving and setting up camp elsewhere in the world.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In a matter of minutes anyone with very basic "technology" skills is able to set up an Internet site. While an "over-zealous" legislator may see some harm in this free expression and basic free-market principle, those of us who value the fundamental principles of Liberty are discussed that this even even under serious consideration.

Sincerely,

Ken Kreitz

Regarding the matter of preserving the open Internet: GN Docket No. 09-191, WC Docket No. 07-52:

The government has no legitimate role in the internet, and its involvement is immoral. A government's proper role is only to protect individual rights, and laws already exist which will protect rights in matters of the internet.

Furthermore, government regulation will hamper or render it meaningless.

Except as a blatant power grab and violation of free speech rights, there is no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I believe the internet works wonderfully as it now operates. We do NOT need to have the government regulate anything about it. We citizens have been allowed to think for ourselves thus far and determine how we wish to use it. Please do not take away one of our few remaining freedoms.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

As an American, I submit the following comment regarding preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is Freedom of Speech. Block it any way & it's the end of America.

Now, if you want to help, go for the crimes they perform OVER the internet.  
Such as Child Pornography. Anyone doing this over the internet is a criminal... arrest them. Shut down THAT site. Are they doing Terrorist activity over the internet? Terrorism is a crime. Shut down THAT site.  
But do not throw the baby out with the bathwater!!!  
Freedom of Speech is not a crime!

Transforming the Internet into a government-controlled public utility is not a path I want to see America going!

I am totally against the government takeover of the internet. It will only result in something that dosen't work very well and will cost the taxpayers more money. The Internet is a communication facilitator. Whatever is posted is up to the person who posted. It is a great example of free speech.

The Government wants to control what is broadcasted over the Internet. We can no longer trust the news media to give us all the information and that it is not slanted to meet some political viewpoint. It is our only option to get good information.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

Any form of regulation on the internet now would take away its freedoms, which will inevitably make it a biased instrument for a governing party of control. The internet is too great a tool for free expression to be controlled. Its freedom from control is what has made it so great. The internet stands as a symbol of the freedom that our Country was founded for. To limit those freedoms is a slam against the Constitution of the United States of America. Anyone who wishes to control the internet can not have good intentions for their plan. Instead, I submit that anyone wishing to control the internet has selfish agendas in mind that will not benefit the good of the people. There are plenty of options for people who want to protect themselves or family from internet contacts that are morally questionable. Internet regulation would be totally wrong, as it would just be a way to take away freedoms, instead of increasing them. We must stand for our freedoms now in this country, more than ever.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior (actually - The internet in its current unregulated form is the most competitive), there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Leave our freedoms alone in this Country, especially the internet.

As an American Citizen, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

As an Americans for Prosperity activist, it has come to my attention that the government is once again trying to over-regulate a critical piece of our free market system. The failure to even attempt this when there is no successful track record as a reference point is rather assinine. Additionally, the rightfully paranoid see another power grab of a key piece of our freedom of speech infrastructure that is unacceptable. Futhermore, potentially stifling communication stifles our ability to innovate and maintain competitiveness in global high tech markets.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I believe in freedom. The Internet, as it stands now, is the most free place for expression.

Government meddling (China) with the Internet, its content, its availability, its format, its business model, or any other aspect of it, can only cause it to be at the mercy of various political whims.

It isn't broken. Please leave it alone.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional phone and cable companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously, it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will inhibit and overly burden business models that may otherwise be economically efficient. This will impose uncertainty and create litigation risk. Such restrictions and related increased risk would lower or at least appear to lower the rate of return on investments in building network capacity to the point that many such investments would no longer make economic sense.

The Internet would then either be crippled or have to be “rescued” with taxpayer subsidies, which would accordingly bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and so called Free Press founder, Robert McChesney. These are not spokespeople for what would make a better business model, but instead, representatives of a frightening socialist agenda.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us further down the nightmare to socialism.

I am very concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The "Government" was created by our founding fathers to PROTECT the common interest of the then "New America". That common interest being the principle of FREEDOM, LIBERTY, HAPPINESS, LIFE AND MANY OTHER INALIENABLE RIGHTS given to us at birth.

Things such as "open internet" are the seemingly small, yet very large and forceful ways our excuse for a real Government is taking control, and in turn taking away our rights, and the protection of those rights and insuring that our country will fall, and our constitution be no more.

NO TO OPEN INTERNET!!!

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I am adamantly OPPOSED to government regulation of the Internet. Private business invests in delivering products and services and that competition delivers outstanding service to customers across the US.

Additional government bureaucracy will drive up costs, increase taxes, and add complexity to the business environment all of which increases costs to consumers and reduces access.

DO NOT attempt to increase regulation on the Internet. The government has NO RESPONSIBILITY and NO AUTHORITY in the Constitution to regulate private business like this.

UNACCEPTABLE!!!

Keep the government out of our lives and homes! You work for us, not us for you! Remember that! We will replace you in the blink of an eye! We are sick and tired of big government!! And our supposed president is not even a legal resident, You know it and so do we!! The United States of America belong to the citizens, NOT the government.

Our founding Fathers had the insight to know this would happen if government got too big and power hungry. We will not tolerate it any longer!! Be well aware of the citizens and what you have been told. We mean business and are not afraid to defend our country against tyranny. We did it once and we can do it again! You best heed the Constitution and Bill of Rights you swore to defend and uphold when you took office. You have awakened a silent Eagle with sharp talons! Beware, power mongers!!!

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a concerned citizen, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. If a private company blocked or censored Internet traffic it would lose its customers. Our current system is working. If government exercised control over the Internet as proposed, there would be no place to turn; there would be no competition ensuring a true open society. The government run system would be what the "government" would want.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

You propose rescuing a system that does not require it. The free market open internet system works. A government takeover would inevitably bring politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This isn't nor should it be the Commission's responsibility.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is no rationale for imposing new regulations that could negatively effect innovation, growth, and expression that the current and competitive Internet has become.

On top of all the above, control of the internet would be a violation of freedom of speech, freedom of the press, and my personal freedom to view what I choose on the internet. My work also involves use of the internet and I am not self-employed. I am against this due to my right to work at my job and in defense of the company that employs me to accomplish their goals.

I am tired of the government interfering in all aspects of my life. You do not know what is best for me. Only I know what is best for me.

The U.S. government had better step back take a breath and consider that we are your bosses, not the other way around, so stop telling us what we can smoke, eat, drink, or read or watch or view in books, on TV and in movies, as well as on the internet.

Butt out why don't you! You are making an increasing amount of your constituents extremely angry and they may eventually hand you your come-uppance. I know I am ready to do so and have been for some time.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I work in this industry, and have been a supervisor or manager at several telecoms and internet service providers, including Qwest, Verizon, Cogent Communications, NTT America, and Transaction Network Services. As it exists today, the industry is not 'broken', nor does it need fixing, nor regulation as proposed. The government should only step in to stop illegal activity, as it does now with the full cooperation of the providers, on problems such as scams and child pornography.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This will be similar to a DDOS, which is a Directed Denial Of Service attack, where a hostile entity attempts to shut down a providers traffic, and the affect will be the same: the providers will be damaged and the customers will lose services.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Continued free competition is the best way to ensure fair representation on the internet, just as is the case with other media outlets. Every time the government steps in, regulations become burdensome, cumbersome, and both the provider and the customer is harmed, not helped.

Thank you for your consideration.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will be counterproductive, discouraging companies from providing the expensive infrastructure necessary to increase network capacity to the point that some of those investments would no longer make economic sense. Worse, this concept picks private winners and losers, with a wealthy company like Google being subsidized by depressed companies like AT&T and Verizon.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a concerned American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Regulation should be an option of last resort to resolve a far reaching problem. The problem that this regulation is purporting to solve does not currently exist. The regulation is therefore unnecessary and inappropriate at this time.

Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I am not in favor of government interfering or taking over private industry or limiting our freedom of speech via the internet or any other venue. Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. And I don't trust those in government at this time to make good decisions for America. The Commission should not on its own set into motion regulatory changes that will force us down this path. This, to me, is a path to the long-desired censorship on the part of those radicals (elected and unelected) in our government, and is a tactic of communists, Marxists, socialists, fascists, tyrants and dictators.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. I am submitting the following comment regarding the matter of preserving the open Internet, GN Docket No. 09-191, WC Docket No. 07-52:

I trust the free market under the free enterprise economic system (what's left of it). If a private company blocked or censored Internet traffic maliciously it would lose its customers.

I do NOT trust CONgress, gubmint agencies or bureaucrats like you. Everything the federal gubmint has touched has turned to \$#!+. Just look at the last two years. The blame must be placed entirely with the federal government, the (not really) Federal (with no) Reserve and their crony banking/corporate interests. Unlike the internet service providers, we cannot fire you or would do so in a heartbeat.

The internet was created and has been working just fine without your "help" (i.e., control). Get your own house in order and leave me and the internet alone!

"In framing a government which is to be administered by men over men the great difficulty lies in this: You must first enable the government to control the governed, and in the next place, oblige it to control itself." (Alexander Hamilton)

Please recognize that the meteoric growth of the internet was effected by private investment and ingenuity. Discouraging private investment through confiscatory rulemaking would be a way to bring an end to one of America's most important competitive advantages.

We cannot afford to pile one more load on the free enterprise back without great risk of breaking it.

Ultimately a net-neutrality regulation would be an abrogation of the private property rights of those who have invested in internet infrastructure and one more nail into the coffin for free enterprise and free speech.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Are we becoming a communist nation. .with this horror of a socialized agenda from Congress and this Corrupt WhiteHouse with Czars and crooks and cronies. . how dare you want to take control of more of our lives. .especially the internet. Enough is enough of this socialist agenda which follows with communism. . .who do you all think you are. ..Get a life and job and leave the internet and companies that manage it alone. ...Less government is better government. If you want to control something control the spending of this Administration and the Cronies and Corruption in Congress

These heavy-handed proposals to steal the internet from private citizens sound quite familiar... Isn't that one of our complaints about the Chinese Communists--Government Censorship of the Internet? Regulation at this level of detail is indistinguishable from control, which leads to nationalization (THINK POST OFFICE!! HORRORS!), which leads to politicized control, which leads to censorship, all of which is a temptation our government has already proven itself incapable of avoiding--just like the Chinese. Nip this disaster at the outset!!!

By remaining non-political, and non-controlled by Government, the Internet serves as a marvelous instrument for research and growth in knowledge for youth and adults when doing schoolwork, or for self-development. We used to have a free press in this country, but alas, that no longer is the case. We have to read news from other countries to learn what is happening in THIS country, and news we should know for our own good. Why has not the FCC investigated this very undemocratic control over our news media? It makes our "news" not "fit" to read, because when it only "parrots" what it is told to say, it becomes propaganda and managed "News". It can no longer be counted as reliable for reporting the news unbiasedly.

Since the Administration has sent us back to the dark ages by restricting our "free press" in newspapers, radio and television, it would be gross negligence on the part of the Federal Communications Commission (FCC) and smell of "dictatorship" influence, should any limitations be placed on the free world-wide Internet.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

We are especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a concerned citizen, and an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

Aside from the above, regulating the internet in the way that is likely planned by the administration will result in the further loss of freedom of speech and the freedom to exchange ideas and information that is vital to the "workings" of a healthy, moral, intelligent, productive society. The citizens of our country will be ill served by a government that restricts internet communication/expression. In fact, the citizens will be cut off from this dynamic method of ensuring the continued survival of our republic.

The government takeover of the Internet would violate the U.S. Constitution as far as owning a privately run industry as well as violate the First Amendment once the Internet gets under the jurisdiction of the government then they will regulate it with restrictions that will limit the right to free speech and also could easily regulate it where no one can contact the outside world!!!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Before reading the comment below, to which I fully agree, I would like you to hear straight from my own thoughts on the issue of regulating, or Stalinizing, the internet. China today regulates what its people can and can't see, and leaders of the United States frequently call for deregulation so the great people of China, its common citizens, can find out the truth for themselves.

Iran is doing the same thing as we speak. As protesters and journalists rush to their computers and cell phones to alert the world of the true happenings within the borders of Iran, websites are being blocked and cell phone coverage disrupted, so a corrupt and violent regime can maintain control.

Any act by the FCC to limit the content of the internet will bring the same characterization, corrupt and controlling. You not only take away the God given right to chose for one's self, but you begin to manipulate the direction of a free nation toward one of decades and decades of poverty, war, and isolation.

These same things have happened throughout history and we will suffer the same fates as the USSRs and Chinas that have gone before us if you continue to pursue such an unjust, unlawful, and unconstitutional path.

As an American for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. I respectfully submit the following regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is, and should remain, highly competitive. There is no justification for imposing new regulations that would unquestionably slow the impetus of innovation, growth, and expression that the competitive Internet has become. I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately assume authority for which competing interests should be prioritized.

The proposed burden of proof for requiring network management practices is an unreasonable constraint and will strangle the free development of business ventures that may be economically efficient, impose uncertainty in the market, and create litigation risks. Such restrictions would lower the rate of return on investment in building network capacity, discouraging further investment and crippling the growth of the internet. This appears to be a desired outcome of many proponents of regulation, such as former White House adviser Susan Crawford and Free Press founder Robert McChesney, since it would put the internet into position to be "rescued" with taxpayer subsidies, inevitably bringing government control and politicization along with government ownership. If a private company blocked or censored Internet traffic maliciously it would lose its customers; however, if government exercised control over the Internet, there would be no other options available.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, our legitimately elected legislative branch of government. The Commission should not allocate to itself regulatory changes that will force us down this path and restrict the freedom of the internet.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Programming and Websites will live or die under their own accord due to their popularity or lack thereof. I do not want the FCC or any other government body dictating what can be viewed or violating our First Amendment protections.

We must find a way to preserve the open Internet. My remarks are in reference to GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The fact that those of the FCC that are democrats and barack obama want to do a so called "net neutrality" which is not neutral but controls the internet in such a way that only messages that democrats approve get through shows how desperate and evil democrat leaders have become as the only way that they can get their liberal socialist agenda to the people of OUR Great U.S.ofA. is to control and force feed that info as nation wide for over 15 years fewer and fewer media outlets will broadcast the democrat left wing info as citizens will not support the funding of programs that are left leaning because we see through the lies of the democrat leaders and we do not want the evil agenda of the current democrat leaders, further added the current democrat leaders have wantonly ignored the very large grass roots swelling of U.S.ofA. Citizens that have marched in Washington DC and around the Nation claiming that those Citizens are just a few small angry mobs when we number in the tens of millions, but then as is typical of evil tyrants those tyrants ignore all who disagree and severely punish those that disagree even when those that disagree is most of the nation as is currently the case and the current democrat leaders as do tyrants force their evil agenda regardless of opposition and without letting the opposite party ie us Republicans have anything to say in the matter, those democrats are proving that they are indeed the evil angels living as humans during the last days just before the return of JESUS the CHRIST whom most democrat leaders hate as they are atheists despite the label they apply to themselves,,, so I United States of America Security Agent 001 (I still have that Federal ID) hope you are smart enough to not push through your net neutrality agenda which is not neutral but democrat forced control which has so far worldwide has always been extremely evil and hurt the nations... JESUS CHRIST is my saviour and we will prevail!!!!!! Tim Maine

I am not politically savy. I do know that Government takeover is more than just implied in this issue and based on how well our government has handled many government programs, ie FEMA & SOCIAL SECURITY & (possibly) HEALTH, there should be an emphasis on American's to stop this from happening before we become a socialist country, dependent 100% upon Government intervention in every aspect of our lives. For an independant nation filled with proud individuals, this seems truly cock-eyed!

Judith Manuell-Marnell

It is amazing to me that America is managed by politicians. Politicians are very good at what they do, politickin' but that does not necessarily make them good managers. This seems quite evident when we look at FEMA, WELFARE, SOCIAL SECURITY, etc , programs managed by our governmental system. I do not want to see our government becoming responsible for another program currently handled in the public sector. For proud Americans, who are independent, stand-on-their-own-two-feet, individuals, we sure have become a nation of mama's boys.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As such I am opposed to any form of government takeover of the Internet.

In an administration that seems bent on controlling as much power as possible and with very little desire to listen to the will of the people I feel that the government needs to stop trying to make apparent inroads to interfere with our most basic rights including the first amendment.

Please consider the fact that this administration cares more for power and control and what is good for the party and not, as they would try to make us believe our "best interests".

I am available to answer any inquiry you may have and will gladly stand up and be counted in an effort to destroy this attempt on our constitution.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Open internet, just like net neutrality, is a terrible idea. Our country is vanishing in a maelstrom of government regulations and new self-imposed government powers. The internet is not a public utility, but is rather private property, and should remain so. Do not continue to contribute to the fascist expanse of government infecting our nation's economy. If the FCC seizes control of the internet via "open internet," a serious blow will have been dealt to the future of free speech.

My additions:

I also enjoy photography as a serviou hobby, and realize that sending High Resolution pictures over the web takes up a substantial amount of bandwidth. It certainly takes up mroe bandwith than simple text messaging. I want to have the ability to send pictures over the internet, quality picture and many of them. Currently I have choices of service providers and costs. I can match my usage with costs.

Under "net neutrality" the chances are that the internet provider will become similar to the telephone company many years ago before deregulation: simple and not innovative. I much perfer an internet provider that will innovate. The cost of that could be higher fees. But that is OK. Higher fees for higher service is much more acceptable than standard fees with poor service.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please consider the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies are in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Keep the Internet free. The Internet is a series of private networks connected together for the common good. This is done through voluntary cooperation induced by natural market forces and technology derived through market forces. If we wish to remain competitive, we need to recognize the reason why the Internet has flourished and not make the mistake of destroying it through regulation.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I have been employed as an Internet Network Technician for many years. From my perspective and experience, we need to allow technology and private Internet industries to continue innovation. This innovation is derived from the forces of the market. Keep the Internet free. The Internet is a series of private networks connected together for the common good. This is done through voluntary cooperation induced by natural market forces and technology derived through market forces. If we wish to remain competitive, we need to recognize the reason why the Internet has flourished and not make the mistake of destroying it through regulation.

To Whom It May Concern:

I am writing regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The internet is not and should not be a "Public utility." To say that all traffic is equal just shows us that the powers that be have no idea what kind of traffic runs over the internet. If you want to give a granny's 14 word email to her grandson the same priority as a videoconference between two hospitals that are trying to save the life of a newborn baby then we are truly in trouble. Traffic on the internet has priorities just like everything else in life and if you can't see that, then you are as clueless as they come. I work in IT and I understand that certain types of traffic need priority over others. Voice and video traffic are very sensitive kinds of traffic and if they are broken into too many pieces, nothing comes out as it should. Data traffic will get there but when it comes to hearing a voice and seeing a face, a garbled sound and pixelated face just won't cut it. The big bad government didn't invent the internet so what makes it think it can just say to us move over, we know better than you and can run it better than you. If the government thinks it can do better, then let it come up with its own ideas and pay for them with its own money and stop using mine.

Stop trying to force your will on us and let us think for ourselves as we have done for hundreds of years. If you want to see what really happens when a government runs the internet, just take a gander over the pacific at China and if that is what you want for us, then just move over there and leave us alone. They have no original ideas so they have to steal ours.  
Thanks.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive, and should remain so. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If any private company were to block or censor Internet traffic maliciously, it would lose its customers. However, if government were to exercise that kind of control over the Internet, there would be no place left for Internet users to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense, and would therefore not be undertaken. As demand for Internet capacity continued to grow, the lack of corresponding capacity construction would cripple the Internet.

As a result of such government intervention, the Internet would either remain crippled or would be “rescued” with taxpayer subsidies, which would inevitably bring further government control and politicization along with government ownership. Indeed, this “public utility” model is the outcome desired by many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not take it upon itself to set into motion any regulatory changes that would force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted (i.e., dismissed entirely). In the absence of concrete evidence of clearly discriminatory or anti-competitive behavior, there is simply no legitimate rationale for imposing new regulations that would almost surely slow down the great engine of innovation, growth, and expression that the lightly-regulated, highly-competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Socialized healthcare, federally funded abortion, gun control, Copenhagen crap and fake agreement, czars that believe your hamster can sue you, giving praise to chairman Mao, giving billions to crooked financial institutions then scolding THEIR actions after signing the check, buying votes on what the people as a whole emphatically dislike, labeling all of those who like to disagree with policy domestic terrorists, attempting to implement failed practices of other cultures and embracing the wrong people internationally while turning their backs on our allies. No wonder the state controlled media demonizes you "right wingers" all the time. There is no place for values in this agenda. On 09-08-09 the next generation of voters were told not to rebel against the boundaries, along with the constitution they are being removed by a congress and senate who appear to be hearing impaired. Treason is a good description for all of this and in this election we need some "incumbent cleansing". Don't ask for advice from an ivy league graduate, ask a human being. Can you mail me one of those NYC heroin users instruction manuals??? Thanks.

Dickson, Tennessee 37055

I am the owner of BANG! Web Development, and have been professionally involved with the Internet for 12 years.

As an independant libertarian/conservative activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am tired of our representatives not representing us. So far this administration has come inches close to treason. If it ever reaches that point, the only action to that betraying is firing squad. I hope it doesn't come to that, but there are millions that have already called for that in this administration. Fact!

We will be watching, and we wont take the lies and midnight closed door deals sitting down anymore.

For many senior citizens this is their preferred method of communicating with relatives and friends. Censorship would for the most part eliminate their freedom to communicate.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and the founder of the perversely-named “Free Press.”

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Setting into motion regulatory changes that will force us down this path is at the very best disingenuous to the notion of open and public debate, and at worst yet another illegal socialist move by this joke of an administration. Such an action flies in the face of promoting the general welfare, as defined by the Constitution. I also read it as an attempt to thwart the Fifth Amendment (takings) protections afforded by the Constitution.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. The market is the best arbiter, period, end of story.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. Carl Junction, Missouri 64834

I respectfully submit the following regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is, and should remain, highly competitive. There is no justification for imposing new regulations that would unquestionably slow the impetus of innovation, growth, and expression that the competitive Internet has become. I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately assume authority for which competing interests should be prioritized.

The proposed burden of proof for requiring network management practices is unreasonably restrictive and will prevent the free development of business models that may be economically efficient, impose uncertainty in the market, and create litigation risks. Such restrictions would lower the rate of return on investment in building network capacity, discouraging further investment and crippling the growth of the internet. This appears to be a desired outcome of many proponents of regulation, such as former White House adviser Susan Crawford and Free Press founder Robert McChesney, since it would put the internet into position to be "rescued" with taxpayer subsidies, inevitably bringing government control and politicization along with government ownership. If a private company blocked or censored Internet traffic maliciously it would lose its customers; however, if government exercised control over the Internet, there would be no other options available.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, our legitimately elected legislative branch of government. The Commission should not arrogate to itself regulatory changes that will force us down this path and restrict the freedom of the internet.

Katrina Meade

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

All of these measures continue to erode the our nation by changing ideals, corruption, lowering standards, silliness and harmful greed. The decent members of the public are increasingly becoming less protected, as the corrupt majority, taking over by sheer numbers and a rapidly increasing population of citizens of a different ethical character. Those who continue to increase our population with no parental accountability, crime and sloth are taking over in numbers and demand the state's economical support. Our courts and legislature take private kickbacks in their pocket from oil, drugs, and corrupt banking. Despite the false rhetoric to create a misleading public perception that we are getting out of a heinous, uncalled for war, and getting the lobbyists out of Washington, we are dragged into more war for the self serving corporate vulcher lobbies that run Washington. Actually, the opposite of what is promised is happening. Also, the healthcare measure is another example of this government takeover. The government operated entities are wasteful, and the least efficient. The only thing our Congress does is secure their pensions and vote based on kickbacks, which they seem to increasingly be spending on wine and women. Porn on the internet makes more money than any other industry, as I was an employee at Microsoft. The government, as with the poppy market in Afghanistan will increasingly make sure that these undisclosed markets thrive \$. The healthcare measure is all about giving rights to those that sit around, and reallocating things to those that are favored. Decent people are discriminated against. Everybody will receive C care, and nobody will get A care. This will result in the certain secret intended result of population control-esp. of the old. Instead, let's allow the criminals, molesters and parentally unaccountable babymakers to thrive by access to healthcare just because they're young. What is America doing to protect the hard-working decent folks. There is no proportionality in the system anymore between your toil and reward. The sitter arounders will get everything handed on a platter, taking out the critical incentive in the system to work. But, Obama and Pelosi will receive the most elite care. If they believe this is going to be quality care they should agree to be receive the same health care that everybody else is. This would never happen. They don't truly care about the suffering of good people, as long as they're taken care of, they will take away the hard working middle class' quality care.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is a highly competitive, amazing tool of communication and innovation and education. Endless possibilities open up unless it is taken over and regulated, taxed, or jeopardized by government intervention.

Keep the internet free from government intervention and monopolizing the communications market. This bill is not a step for freedom and can not be hidden under language that promotes neutrality but seeks control and limitation.

Please remember that government is FOR THE PEOPLE and the internet serves the people and should not be ruled to death!  
Keep the internet free and open!

As an Americans for Prosperity activist, the following is my comment about preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. IHowever, if the federal government were to exercise control over the Internet, there would be no alternative.

The suggested burden of proof for requiring network management practices is unrealistically restrictive and would essentially eliminate business practices that would well be economically efficient, thus imposing uncertainty and creating opportunity for expensive litigation. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would be rendered crippled and, most likely, have to be “rescued” with taxpayer subsidies, resulting in yet additional government control and politicization as well as government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress with extensive involvement of and participation by the American public. The Commission should not unilaterally inflict regulatory changes that will force result in the Internet freedom that currently exists and serves its stakeholders quite well.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of the alleged “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of substantive evidence of discriminatory or anti-competitive behavior, there exists not legitimate evidence to validate the imposition of new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Although the following comment was written for me, I am definitely in agreement with what it says. I am certain that government regulations in most cases lead to higher cost and less efficiency. The only time this is not the case is when a monopoly exists. I know if no evidence that this is the case with the internet. I also know that government regulations in many cases actually contribute to the ability of one company to create a monopoly. Therefore, I support the following comment.

Ruth Merrill

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet must remain open and free. Yes, I understand there are some risks with this. That is always the case with freedom.

But the advantages far outweigh the risks.

I am sure that you see things in government that you don't like. Right now the Internet is the very best opportunity we have to uncover those things. Nothing else has ever worked and never will.

Whistle Blowers are hardly heard of any more.

The Internet is our Whistle Blower. Look what happened to the corruption in England with the Global Warming issue. It was the Internet that set those liars on the defense.

You will not want to live in a country whose government has the power to control communications and the Internet.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Come on Congress, get a handle on "common sense", this bill is ridiculous !!

Whenever the government has undertaken to "solve a problem" it has only made it worse. How absurd to interject the government into an area where there is not even a problem. Please LEAVE THE INTERNET ALONE!

The government needs to get of the business of making everything its business. Hands off the Internet, the greatest frontier of information transmission and dissemination in human history. Let the risk-takers, markets and consumers decide what will prevail. Gov't regulation leads to stagnation and stifles true innovation. Any attempt to insert gov't bureaucracy is another veiled attempt to erode our constitutinal rights to free speech and assembly. "Don't tread on me" once again needs to become the rallying cry for Americans resisting the restrictions our so called leaders continously seek to impose.

Back off  
Hands off  
Laissez-faire  
Don't read on me

Longmont, Colorado 80503

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

As a builder of last-mile broadband networks, I am vehemently opposed to any regulation of the Internet that would limit service provider's ability to deliver quality, reliable, innovative services. Network operators need the ability to offer differentiated services without restriction, regulation, or other intervention. The current FCC proposal will prohibit the offering of those services. All bits are not created equal as many filings have pointed out.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense and inhibit the development of broadband services in underserved and unserved areas.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This paragraph extends beyond the Commission's authority.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The bottom line is that if it ain't broke, don't fix it and it ain't broke!

Sincerely Yours,  
Mark Milliman

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility would end up with a disastrously crippled service as all such government utilities have become (e.g., Amtrack).

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. Tyrants abound in any age. The Founding Fathers sternly warned Americans of whatever era to avoid anything corresponding to a tyranny of kings, e.g. unknown, unaccountable czars answerable only to the chief executive. Obama has turned increasingly to that power grab ignobly pressed by GW Bush along with signing statements. American freedom has had to renew itself through the blood and sacrifice of those who love this nation and limited constitutional government. The Constitution and Federalism are increasingly shredded by charlatans in and out of government while paying it lip service. We must strongly reject this inroad on our freedoms if we are to be worthy of citizenship in this "last best hope of freedom."

Accordingly, as an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. What this administration wants to do using the FCC as the vehicle to the free flow of information on the internet is akin to what Hugo Chavez did and is doing in Venezuela. Assert control of all forums that make available the expression of thought and ideas that differ from theirs.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Internet providers should be able to "prioritize" certain uses, either through higher prices or in association with selected priorities such as crisis management, law enforcement, national security, medical uses--but at their discretion. So long as all people have access to the internet at whatever fair price the service requires (assuming a competitive and level-field marketplace), the market will develop capabilities and allocate resources most efficiently to provide the desired services and yet provide a good reward for those who innovate and risk to develop and enhance the internet.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. After all, this is not 1939, Germany.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated and rejected in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

There is nothing wrong with any of the communications systems in the United States. The U.S. government has no business "helping" these private companies in any way. Fairness, quality of service and freedom can only be guaranteed by a free and unfettered market. Please end all the initiatives currently in progress that advocate government intervention in the private business of U.S. citizens.

Included below is the text from the Americans for Prosperity web site with which I wholeheartedly agree:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please leave our internet alone. It works just fine as it is. After all, Al Gore invented it!!!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should not even be considered. If anything it should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I would sincerely hate to see the internet become the post office. Absent the ability of companies to control their investment to maximize their customer's satisfaction and maximize their own profits, companies will not invest the capital required to pave the "dirt road" we now have. That would leave government control as the only option and we should all know where that leads.

"Net neutrality" is a stupid idea. It does not matter too much if a file download is slowed down to better manage traffic, but slow down a live video and it becomes unwatchable. Different data streams have very different requirements. Treating them all the same simply will not work unless bandwidth is unlimited.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I, as the sender of this message, agree completely with the statements set forth here and am opposed to gov't intervention or control of content and technologies.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Internet censorship is well known in countries such as North Korea & even China. Bad enough the govt. has taken over private banks & industries, but to try and take over health care & now the internet is extremely alarming.

Our economy has suffered enough, and our children & grandchildren will have enough debts to burden them due to the socialistic/communistic govt. bailouts. To then further hamper future generations economically is not acceptable. This administration has done far too much damage already, and should get out of the private sector altogether -- including the internet. Soon this administration will be trying to regulate the very air that we breathe! Oh, wait ... that's right ... they already are regulating the air that we breathe!

Please, don't do any more damage to future generations.

As an Americans for Prosperity reader, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is already open - and highly competitive. If government exercises control over the Internet, it will no longer be open - and there is no alternative better for fast, free communication.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Lastly, the last thing this country needs is more control over its citizens lives. Last time I checked, this was the USA, not Venezuela. If I wanted the government to run everything, I'd go move in with Chavez.

Countries like Iran and China control Internets, they can shut them down when they want. This is not freedom as we know it here in the United States. We need to keep the internet open, it is becoming a major business in the United States, and we do not want the governments getting thier hands on it and totally ruining it as they have most every other program that they have taken control of.

This is not a Socialist country, and we the American people want to keep it that way. Get Government our o the net.

As an individual American citizen, I am submitting the following comment regarding "the matter of preserving the open Internet." GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive and highly available. There are many providers and all those whose services I have used have maintained a hands-off policy in regard to communications. If a private company blocked or censored Internet traffic it would lose its customers. If government exercised control over the Internet, it would be in violation of free speech, a violation of the First Amendment.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will block legitimate business models, suppress free expression, and create gross inefficiencies that do not now exist. It would create uncertainty and risk of litigation. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would be hobbled to the point at which many would be deprived access to something which is currently working just fine, which is private, and over which the government has no right to exert control. The attempt of the writers of this act intend government control, under government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I strongly oppose this unnecessary action and will make my voice heard in opposition. Leave the internet alone.

Thank you.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

What has happened to our first Amendment rights? Freedom of speech? Why is it fine to hear and read all the evil one can say against Conservatives, Christians, heterosexuals, but we are to praise and love and respect the opposite? The TV is pure liberalism and Conservatives have only a handful of channels to watch? If you think there is anyone on the Internet that is unbiased, it's a lie. There isn't a person ALIVE that doesn't have biases. We all are entitled to our own biases and WOW we have the CHOICE to read OR NOT READ something on the Internet. NO! Abide by the First Amendment of the US CONSTITUTION and give us FREE SPEECH..... It is tiresome how many people forget about the laws of this land. It is time to stop doing it!!

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

To adopt "net neutrality" would be a giant step backwards reminiscent of the days when phone service was regulated (Ma Bell), costs were extremely high, service was abominable, alternatives did not exist, and technological progress was virtually non-existent.

Gentlemen it is imperative that the FCC stay away from the internet. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a concerned taxpayer and user of the internet I agree with the forgoing prepared comments. Any government venture into so called regulation of the internet would actually be a move for power and control of this vehicle of free speech and expression. Any regulation and/or control of the internet should be looked upon as unconstitutional.

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Simply this: Please stop trying to regulate the everyday life of every citizen of the United States of America. The internet works pretty well now. Government bureaucrats will foul it up so that it no longer functions efficiently.

Please apply the common sense principle "If it works, don't fix it"!

Thank you.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I would think that the government has enough to worry about without trying to take over EVERY PART of OUR LIVES. Read the constitution. Find out what your responsibilities are then stick to those. You'll find your life much more rewarding.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Government: STAY OUT OF MY BUSINESS. STOP TRYING TO GOVERN EVERY ASPECT OF OUR LIVES. ABIDE BY THE U.S. CONSTITUTION!

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

The fact that this change is even being considered is highly troublesome, and should be voted on by Americans in an open vote, not by a committee in a closed room.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Not under any circumstances should the FCC regulate any part of the Internet that it is not authorized to regulate at this moment. Government interference has no benefit.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

There is no reason for the federal government to regulate anything on the internet. The free exchange of ideas and information should be considered a natural right. Also, the internet is in use world wide and NO government has the right to control it.

If there is content online that people disapprove of, they have the right to ignore it, to petition the person or organization who posted it, or if it is libelous, to sue the individual involved. There is no need for any new legislation involving the internet, its use or content

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

You all think that you are so clever and can pull the wool over everyone's eyes. What you all want is government takeover and control of the internet; just another step towards a "New World Order" or one world government. I am completely against government takeover of the internet or of anything else.

When are you people at the White House going to start serving the "People" (your fellow Americans). Wake up and smell the "dung" you all are creating for our children and grandchildren, etc. Wake up and see the future "chains" you are placing on all of us and our families...including yourselves I might add. Think of all of our fore bearers and what they fought for and how many died to preserve our freedoms. Now, you and others are willing to ignore past history for green paper that will only bring you temporary happiness and security. Oh, to those with no true purpose of heart. Oh, to those with no kind heart. Oh, to those that are only out to look after their own evil tailbone. Greediness is wickedness, and wickedness was never happiness.

I can't say that I am an activist as this Americans for Prosperity" website would like me to be. I am merely a Patriotic, and a "Proud to be an American", citizen of the United States that has some hind site and is seeing this country going down the toilet. A very sad site to see. I am positive that all of those that fought for our freedoms past are turning in their graves.

I am very disappointed in most every single person employed by or has any connection with the plights of those at the White House. I used to have some respect for those that hold office. But respect is something that is earned not instilled by fear or by demand...or by turning our nation into a socialist society.

Shame on all of you and may God send you what you deserve...although in a more kind light I should say...may God have mercy on your souls. Repent ye, repent ye.

What's next...trying to take over our freedom of speech?

Sincerely,  
Concerned Citizen

As a consumer and voter in America, I have seen what well meaning Gov. officials have done in trying to regulate communications. In an effort to be helpful the free and easy communication becomes a tangled mess of rules and regulations that stops innovation and communication.

Please allow the internet to be free and self regulating. Bad places and bad people will be found out and black-listed and good ones promoted. For some people in the world, the internet is the only "free" place they have to tell their story and read about freedom.

We agree with the following message written by people smarter than us and we are willing to discuss or defend our position with anyone. Thanks,JLP

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, the Internet would be in a mess!!! Government has NEVER been able to run or control anything correctly!!!

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is not a government agency: It is public property. Leave it alone! If it becomes private, the company could block or censor Internet traffic maliciously: It is being done now. Every 5th or 6th site I choose is blocked already and is unlawful; hence error #404. Government control over the Internet is in our way and is against my rights as a citizen: To assembly, free speech, and often, contact with my state senators and representatives.

The Government using [Net Neutrality & Open Network] will get in our way and we will be adrift with no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress: American citizens do not want a regulatory Commission in place to restrict Internet content [paragraph 77 of the NPRM (the Commission may decide interest should be prioritized)].

In the absence of *\*concrete\** necessity, the Internet should be as it presently is; for the people -- not the government. You are not needed and you are not wanted.

Leave Americans in peace with the Internet that we prefer. Thank you.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I want less government control, less government spending, and will fight to keep the rights that have been granted to me by our Constitution and our Bill of Rights. It is time for the federal government to step back, stop the excess spending, and stop the intrusion on the American people as a whole in our everyday lives. You are supposed to be our representatives; NOT OUR RULERS. This is just one more way of taking over total control and it is unwanted and unjustified.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

PLEASE DO NOT PROCEED WITH THE PROPOSED "OPEN INTERNET" RULES WHICH WOULD, IN FACT, DESTROY IT BY DESTROYING PRIVATE INVESTMENT.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Stop trying to regulate every aspect of our lives. Private business, aka capitalism, is the way of America and a big part of our success as a nation. Look at the US post office, which is run by none other than our government, which wouldn't even exist if it weren't for our paychecks supporting you. The P.O. is billions in debt, go figure. Who's running it, oh yea, the US government. Easily 1/2 our measly paycheck goes to federal taxes, sales taxes, property taxes, etal.

So much of what this government does is a huge waste! Quit trying to control the media with your 'net nuetrality' and don't waste our money on Your version of what the internet ought to be. It is not a monopoly, it is competitive and should remain that way. When a business gives great customer service it usually succeeds.

When a talk show host or games show host or auto show or physical wellnes host are successful, it's because they have talent and engage the audience, they've earned their right to be heard.

Neutrality doesn't exist in the real world. Some work til their skin and bones and can barely put food on the table and keep up with the mortgage, others sit on their .....chairs all day drinking coffee and talking it up with co workers and dine in fancy restaurants making more money than they know how to wisely spend. Life is not fair, it never will be. Quit trying to fix things.

Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney. Keep your hands off this one. Why do you feel the need to control every aspect of our lives? The citizens of America, who pay your extravagant wages, are going broke because of your constant waste of our money and your poor use of time.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. When you try to fix what isn't broke you end up with unnecessary expense, wasted time and energy, and frustration to all of us.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a small business I depend on the internet to bring customers to my site. We can't afford gov't to ruin a profitable business model and then use more tax payer \$ to subsidize it the same way you are doing with our health care. Why is the European model better with their slow growth rate and huge bureaucracy?

In RE: GN Docket No, 09-191, WC Docket No. 07-52:

I am deeply opposed to government control of the internet. This is not China. I believe the purpose of government control is to gain more power over the information available to the people, as they do in China. It totally destroys the whole concept of freedom of speech and freedom of information.

This is totally against the US Constitution. If you do this, I will support a lawsuit to stop you.

In addition, I firmly believe that the FCC is attempting to exercise powers and control that are not granted to it by either the Congress or by any extension of the Constitution, and that any attempt to control the Internet via the so-called "net neutrality" are a direct contravention of the First Amendment. In addition, I firmly believe that, because of actions like this, it is high time to challenge the Constitutionality of the very existence FCC, and/or put very, very strict limitations on it's authority or ability to restrict or control the open exchange of ideas and information over the Internet. Such Government interference is directly opposed to both the General Commerce clause, as well as the entire concept of "General Welfare", and must be opposed in court, if necessary.

The American people will never stand by and allow The US Government control the internet. We've seen the mess they have made of everything else they've taken control of - chaos, debt and runaway taxes. They simply have no business in our private lives. Hands off you Washington mafia made worse by the Chicago mafia!. Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I think it's highly unlikely the Government will have any control over the internet, as every person who uses internet will fight this and it will fail.

Concerning GN Docket No. 09-191, WC Docket No. 07-52:

I am completely opposed to any action on the part of the commission, or any other government entity, where the internet is concerned.

No government agency, especially the FCC, should be involved in further control or regulation of the internet. I see no authority authorizing such an action granted in any portion of the U S Constitution, or other such documents, where control of citizens lives or freedoms are concerned.

As it stands, the FCC, Congress, and every government agency allows telecom companies to provide whatever service level they choose, at whatever price they choose, and if a customer has an issue, NOTHING will be done. The entire system is skewed toward these companies, and the government, so long as the telecoms continue to make "contributions" to elected officials.

In reading the NPRM, I note many areas where words such as "harm", "harmful" are used. It is ridiculous to assume that the FCC - let alone the telecom companies - should be allowed to dictate what is harmful regarding traffic and/or congestion.

As the owner of an ecommerce business, I do not trust, nor should I given the track record of the FCC and/or Congress, to provide my business with access. At every opportunity the government has refused to enforce telecom law on the telecom companies - in favor of the monies it receives from those companies. This is not a coincidence.

I have watched the government provide billions to telecom companies with a deadline - this too was under the excuse of "management" and "parody" to provide broadband access to most citizens.

It hasn't happened. And when Congress was to enforce the deadline after providing billions in tax breaks and actual funds to develop the technology - they let their friends off the hook.

The result has been a disaster. It is now 2010, and many areas have no broadband access. Those rural areas that do typically pay as much as 10x more for the service, and it's inferior to what the cities enjoy.

The government just provided hundreds of billions MORE in money to these same companies - and for what? Now they can't handle congestion.

Again - this is nothing more than a veiled attempted to initially allow telecoms to control traffic and access to the internet - and once they see profits deteriorate, the good ol' FCC will be there to help! - NO THANKS.

As a licensed amateur radio operator, I've watched the FCC carve up the spectrum like a roast for over 20 years - and every time it has, it's under the excuse of management. In fact, it's been a money making venture for the FCC, and government, with the FCC acting as "auctioneer" for portions of the spectrum.

My answer to this takeover and further control by the U S Federal Government of the internet is Hell No.

I agree with the comments included below which is a form email being sent by members of Americans for Prosperity. Please review the comments.

Sincerely,  
Michael Ratican  
Peru, IN.

Net neutrality is abhorrent to proponents of free speech. Let the public decide what we want on the internet. Maybe we don't want neutrality. That is our prerogative.

Also, prioritizing net traffic based upon some arbitrary government rule instead of individual business decisions promotes waste and inefficiency and discourages innovation.

Please, do not regulate the internet. You regulated power companies, cable companies, the railroads and where did it get you. None of these industries are as advanced as they could be.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The American people do not want an government-controlled internet and media like they have in China and Venezuela.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This should NOT be contemplated in a "free" society, which I maintain the citizens of this country demand. Regulations are one thing, but government control and forced regulations implemented by a Commission with a political agenda should not be tolerated. The first thing that is done during a coup in a country by a "dictator" is the taking of the media, of which the internet is now a part. We are in a very crucial period in our country's "life" and this type of regulation would certainly be tremendously detrimental to the survival of the greatest country in the world.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and freedom of expression that the lightly regulated, competitive Internet has become.

And furthermore, altho there is no defender I can see in the Obama White House, this is a clear violation of Constitutional constraints placed on the Federal Government! this is a violation of 1st Amendment rights, and a fair court - one believing in the defense of the Constitution - would agree that FedGuv has no legitimate place in this issue.

I have read and agree with the below. There needs to be some source of free speech left to Americans. the internet is free and the individual is free to read or not read as they see fit. The internet does not represent any one entity. I fear the us government far more than any efforts of terror. no one in the federal government or any other government is wise enough to comment on the content it holds. if commerce is against the individual we can deny our support to commerce. If we disagree with the government we stand a chance of arrest. Don't you young arabs of power try to teach your elders how to suck eggs. if the government does anything it is assured citizens will suffer

ken r

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

It is unfortunate but true that governmental regulation of industries does not benefit industries or consumers but increases bureaucracy and costs. In this economy, the last thing this nation needs is more government intrusion in business and life, and more government spending on what should be a last bastion of freedom.

OPPOSE: GN Docket No. 09-191, WC Docket No. 07-52:

Government regulation of the Internet will interfere with the continuing evolution and freedom of the digital age. Keep government out of just one thing, please!

Net neutrality cannot be achieved by government as the mere monitoring and regulation of any activity is not neutral. Neutrality and an "Open Internet" will only be attained by free will and public and market pressure.

As an IT professional and user of the Internet I am opposed to government intrusion and demands. The Internet should be free from government force majeure.

Please oppose this proposal!

The internet comes under the Constitution and the Bill of Rights as far as freedom of speech and every thing else that goes with that. We all know the government can't even run it's own house let alone adding another house to their list. To me and many, many people I communicate with, it looks like just more government takeover for more power. Leave well enough alone. It has worked just fine without your interfearence, so let it be. It is working just fine and we do not need the government trying to control it and MUCK it up for the millions of users. Just leave it alone please. Thank you

Vernon Rice

As a result I am vehemently opposed to the “open internet” rules proposed. To replace the current environment and its competing forces with what will ultimately become a centralized government run utility runs counter to the principles that this country was founded on. Instead of preserving our freedom of speech and choice these regulations will put the government in charge of controlling this important communication tool which invites suppression of free speech at the whim of the unelected bureaucrat’s. Having traveled to the country of Oman recently I have had a personal experience with a government controlled internet and it was startling compared to our open infrastructure. One needs only to look at China and Venezuela to appreciate the danger in allowing a government to have control of this important communication medium.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The Government needs to DOWNSIZE, not grow. The Internet works fine the way it is, there is NO need for things to change!!!

Keep the Internet competitive and not a government run utility. Keep out of our private business.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I believe Government control of the Internet is just one more area that the current Administration is determined to put under government control.

I still have not been able to find anywhere in the Constitution where that power has been given to any branch of the government.

I have a hard time distinguishing how this effort is different, in any substantive way, from the government attempting to regulate the content of newspapers, magazines, periodicals, or newsletters.

The Internet is highly competitive; both with regard to the 'Providers' and content. If a website or Forum contains material that not enough people care about, or agree with, the marketplace will determine who survives, and who doesn't. That's as it should be - not decided by some Czar chosen for how well his or her ideas fall in line with the 'Power that be.'

Once the government exercises control over the Internet (or, anything else, for that matter), there is virtually no way to wrest control away from them. One notch at a time, we are ratcheted into a Socialist State.

From a more practical viewpoint, and to get away from my vehement opposition to the government thinking they (it) can run anything better than the free market system, let me express more pertinent concerns.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. As an American activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

At the present time the Internet is highly competitive and has been so for the past decade. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers; For the US Government to do so would be an unconstitutional interference with the right to free speech. See Google's struggle with China's governmental censure for an example.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that are economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then become crippled, supplying an opportunity for the government to "rescue" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I oppose the transformation of the Internet into a government-controlled public utility; this is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

The dire claims advanced by advocates of so-called "net neutrality" should be heavily discounted, if not ignored entirely. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could slow down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Sincerely,  
Ralph Robinson

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am opposed to the attempt of the FCC and the Obama Administration to regulate the free flow of information on the internet. Nowhere in the US Constitution is the government given any authority to control or regulate free speech, free enterprise or free information exchange. Government takeover of the internet would cripple our free enterprise system and would make America less free. It would disconnect Americans and hurt American businesses that depend on the internet. I urge you to support a truly open, free internet that is competitive and privately owned without the restrictions of the government. The job of the government is to preserve that freedom, not destroy it.

Enacting such a measure would be a major step toward eliminating the First Amendment of the Bill of Rights of the Constitution. Although this Commission is not a duly designated legislative faction, this intrusion will ultimately lead to the suppression of free speech. This contention is supported by the fact that this administration in particular, has repeatedly displayed its disdain for the limited powers outlined in the Constitution by its appointment of numerous individuals with unrestrained powers and allegiance only to the White House, who may function at will as legislators EX-OFFICIO. We do not need more intrusion, creating a problem to address where no problem originally existed, by a government that CAN NOT and WILL NOT police itself within the confines of our own Constitution.

Personal comments...

Networks that don't work: Amtrak, Post Office.

Networks that work: The Internet, Cellular services.

Guess which were frozen in time and space by the government?

In the same years that the alarmists have been crying that they needed "Net Neutrality" or similar regulations, the range of services and speeds available to the public has increased exponentially, even as prices fell. My personal internet service has quintupled in speed for less money, and the reliability (as evidenced by the quality of VoIP calls over the broadband connection) has improved. Meanwhile, DSL and satellite services, not to mention 3G cellular, aggressively compete to take my business away from the cable company, who wouldn't be so stupid as to mess with my traffic.

More and constantly changing regulations = less innovation.

Bah, Humbug!

Please do not regulate Internet traffic - Keep It Simple, Stupid!

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path. If the members of the present Commission insist on this course of action, they can and will be removed, and their ill-advised actions repealed.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. The government has no reason to do this, other than to push its own liberal agenda. Nor does it have the right to do so, other than to grow government and strangle opposition. If liberals cannot make a convincing case for their brain-dead policies, they have no legitimate business forcing people to listen to their warped, hate-filled rants - least of all, in the name of "fairness". Apparently this proposal's backers can tolerate anything but opposition.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. So-called "net neutrality" is just another liberal power-grab, another attempt to take away freedom, and another attempt to force taxpayers to pay for liberal wet dreams.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

THEY TRIED GOVERNMENT CONTROL OF THE MEDIA IN THE SOVIET UNION AND IN NAZI GERMANY!  
ANYONE WITH HALF-A-BRAIN SHOULD REALIZE THAT GOVERNMENT CONTROL OF MASS MEDIA SUCH AS  
THE INTERNET IS A DAGGER IN THE HEART OF FREE SPEECH!

The US Government should not interfere with my ability to communicate. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Keep you hands off the internet!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. I am commenting on the preservation of the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Government needs to quit trying to takeover enterprises, which the internet is. Some regulation can be positive in some situations. However, what's being proposed will only lead to a government-run internet that will be neither unbiased or truthful.

Please stop this venture to preserve free speech as it was intended.

It's all the same folks, internet take over, socialized healthcare, etc. It's simply about power over the people by a few elitists. Only chance we have is to shake up both houses of congress this Nov. I am ashamed of both so called republicans and democrats right now. They vote their selves a raise yet for the first time do not give SS recipients a cost of living raise. I am first and foremost a conservative and I will never quit bugging my reps by phone or email on things that limit my rights given to me in our constitution. Big government must be stopped and put back in it's place in a peacefull way of course by our VOTES! Wake up America you snooze you loose.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I am not only an IT expert; I am the owner of a small computer and networking business. I have more than a cursory understanding of how the Internet works.

We suggest providers that work well and explain what doesn't work well with others. Providers that made any attempt to censor, block, restrict or enhance specific traffic have and would be damaged by those actions within the scope of the free market.

The existing system works and the government is looking to fix a problem that doesn't exist.

I have read the proposal and based on the text, damage could and I expect likely will be done to not only the performance and openness of the current structure, but to many providers and consumers of the related products and industries.

This intrusion is unacceptable, unnecessary and must be stopped.

Thank you, Brad Schaeffer

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The internet has become a huge success because it began as a new medium not hindered by government limitations or incentives which affect the course of other mediums daily. This has allowed individuals and business to be creative and competitive. Let this medium continue to be free of intervention from individuals who impose their version of "good will" and "just intent". Otherwise, it too will become a football which changes color and size based upon the wishes of individuals which come and go as governments change. No medium can flourish under those conditions.

Thank you.  
Jerome Schmitz

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

What we have today is an Internet that works, it is competitive, and most importantly, IT IS NOT BROKEN. Please do not try to "fix" it or make it better. The cost of Internet service is astonishingly low considering the service provided. When governments run telephone service the rates are high and if you manipulate the Internet as described below it will lead to government control, inefficiency and bring those kind of rates back. Then you will somehow make it become a burden to the already overburdened taxpayers. There is no need to make the Internet "Open", it is plenty open already. There is no free lunch, someone in the end has to pay, or else service that you claim is "equal and fair" for everyone (which sounds just swell to the naive) ends up leaving everyone with a mediocre, expensive, government run debacle. I request you do not do this. There is NO evidence that it is needed, and if there were your proposed "fix" will cause much more damage than any so called "Open" benefits.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

I am not now and never will be an Americans for Prosperity activist, so I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I have read information from both sides on this debate. I've decided that the more truthful points are being made in favor of "net neutrality." Although it is apparently true, as Phil Kerpen from Americans for Prosperity and Newsmax say, that competition is intense among media companies, phone and cable, isn't it MORE American to ensure that this great playing field of the internet remains accessible to all players?

Like television and radio "airwaves", electronic communications must have "public access" and strong FCC rules to guarantee that access.

I think Mr. Kerpen is disingenuous when he says in his Newsmax email that we all need to fight against your rulings because "as long as the Internet is free, we can use it to communicate, educate, and organize." However, in the petition he wants me to sign at the Americans for Prosperity website his arguments are clearly in defense of corporations and against "restrictions would lower the rate of return on investments their current investments." Clearly he is talking about "free enterprise" for the few corporations that are currently in control of the market.

It would certainly be a problem should the FCC ever be stacked with Commissioners who "blocked or censored Internet traffic maliciously...." But, again, I disagree with Americans for Prosperity that it was be harder to correct this policy in the public domain than the supposedly self-regulating corporate marketplace.

No, I ask that you as our public Commissioners accept responsibility for enacting strong rules that keep the Internet free from the chance of corporate blocking, censorship and discrimination. Ensure that Internet service providers disclose all efforts to manage content, as proposed, and protect "Net Neutrality."

Ben Schudel

I oppose needless regulation of the internet. The current proposal would seem to put an artificial condition on the internet which would limit the ability of free market forces to select only those services which are economically viable. If there is a demand for the individuals expressing themselves via email or blogs there will be a service to support such activity.

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

**THIS ADMINISTRATION HAS ALREADY DONE TOO MUCH AGAINST OUR CONSTITUTION. WE ARE NOW WELL ON OUR WAY TO BECOMING A SOCIALIST-DICTATORSHIP. STOP IN GOD'S NAME!**

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

If government makes sure the Internet is "open," then it has the power to close it to politically unpopular parties. The companies that maintain the Internet's infrastructure and allow data traffic have the right to use their property as they see fit. Government has no right to control other people's property.

As Americans for Prosperity has written:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If and when a private company blocked or censored Internet traffic maliciously it would certainly lose its customers. However, when government gets the power to exercise control over the Internet, there would be no place for Americans to turn.

The notion envisioned for "burden of proof" for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably mean complete government control along with politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including the wildly outlandish ideas of former White House adviser Susan Crawford and "Free Press" (only free if it's GOVERNMENT FREE) founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a dangerous major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not and in my opinion has no regulatory right to set into motion regulatory changes that will force Americans down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells (crying wolf!) now for many years. Starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators", such claims as these should be patently discounted or disregarded out of hand. As there is complete absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the ultimate and immediate effect of slowing down the great engine of innovation, growth, and expression that the lightly (or UN) regulated, competitive Internet has become.

I close by saying that government has: 1) no hand in anything "neutral" or "free"; and 2) when the government's hand is introduced, that which is or was free or neutral has by definition lost those very admirable traits.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

As it should be in a "free enterprise" country, the Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers. Wireless is rapidly becoming another viable alternative to wired broadband connections. A private company should not block or censor Internet traffic maliciously if so, it would lose its customers. Government should not block or censor any part of the internet used by private citizens.

The burden of proof for requiring network management practices should not be unreasonably restrictive and will prevent business models that usually are economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

We do not need for the Internet to be either crippled or have to be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

As a heavy user of the internet for both domestic and international communications, I am deeply concerned about the Government's proposal to control the internet. I have not found the current internet setup to be lacking choices of ISPs for users like me, and I've had first-hand experience with governments who totally control and censor internet access and communications.

While that is not the stated intent of the U.S. Government's proposals in the referenced Dockets, the provisions of those proposals would make it too simple for the Government to take total control of internet access and internet content.

I urge you not to approve the Government's proposals outlined in GN Docket 09-191 and WC Docket 07-52.

Deeply Concerned For Our Constitutional Freedoms,

James Serna III

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. PROTECT FREEDOMS...DO NOT TAKE OR RISK FREEDOM!!!!

Michael Shaffer

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, is not the a viable answer.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent businesses from being economically efficient. This will impose uncertainty and create litigation risks.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells; however, this only rings of "control" over the freedom of speech. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I strongly object to these efforts of the "Open Internet" proposed policies...please do not allow this to proceed.

australia

adelaide, Washington 253/564

It's just another step by the USA to rule the world by stealth. The puppet masters in the US have always wanted to take over the world and its citizens are just as bad for allowing it to happen. They appear to believe that the USA is the world. The rest of the world is not happy. The US is the only nation on earth who believes that it has the right to invade any country it disagrees with or has a financial stake in. It has invaded over 60 countries since the Vietnam conflict using various excuses. The latest excuse is the so called war on terror. The true terrorists are the US itself who bully, threaten and ultimately invade countries who they disagree with. The internet is the last source of the truth (if you can sort it out from the bullshit) and free communication. All other forms of media is controlled and corrupted by the power brokers and the puppet masters. Just like in the movies, judgement day is coming. The war for true freedom of expression is still raging and the US is its biggest enemy. this is a warning to all those who believe in free press and honest communication. BEWARE the US gov is coming to take you away.

As an American Citizen and Taxpayer who strongly endorses the activities of "Americans for Prosperity", I support the following comment regarding the matter of preserving the open Internet, GN Docket No. 09-191, WC Docket No. 07-52, and have added my personal opinion in the last two paragraphs:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am vehemently opposed to the government having any control over the Internet. Land and cell phone service, cable and satellite, gas and electric...all of them are exorbitantly priced and less competitive because of government fees, taxes, regulations, etc. In general, INTERFERENCE! Geez, we just got rid of the Spanish-American War tax on our phone bills!

In addition, taxpayer subsidies, i.e. the FCC taking MY tax dollars to sprinkle where THEY see fit is not only arbitrary and "taxation without representation" but enables poorly run entities to then become "too big to fail." Have we learned NOTHING? A healthy, competitive, free market will naturally weed out lesser performing companies, thinning the herd and improving the gene pool, duh! And Lord knows we still have plenty of attorneys and ridiculously generous juries for anyone unfortunate or dumb or lazy enough to stay on such sinking ships. Get your hands off FREE ENTERPRISE!!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Federal Government is not doing a very good job running all the things they do now. There are too many people with selfish interests to fairly govern the people who elected them. We elected these people thinking they were going to represent us, at this point in time they are not representing the people. They shouldn't be allowed to take over the Internet.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. I am writing regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is becoming another alternative to wired broadband connections. If a private company blocked or censored Internet traffic it would lose customers. If the government exercised control over the Internet, there would be no options. The burden of proof for requiring network management practices is unreasonably restrictive and could create litigation risks. Such restrictions would lower the profits on investments in building network capacity. This could cause some of those investments to not be economically feasible.

The Internet could have problems which could eventually lead to government intervention and control. This government control is what many proponents of regulation, such as Susan Crawford and Robert McChesney would like to have happen. This should be decided by Congress, not by unelected government officials or a commission. I am concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Without concrete evidence of discriminatory or anti-competitive behavior, there is no rationale for imposing new regulations that could have the effect of slowing down the innovation, growth, and expression that the Internet now has.

#### FCC Regulation of the Internet

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I am a former 3-term MI state legislator, 2-term County Treasurer and have been a small business owner of a financial planning practice with my wife for over 20 years. Currently, I involved in bringing new products and systems to the market, and am over several faith-based 501 (c) organizations one ministers to Native Americans and the other is a disaster relief group. I am also a FEMA certified trainer and have on the MI NFIB Leadership Council since 1992. The reason I listed all this is to let you know all of my contacts and business relationships are opposed to you in any way, shape and form regulating the Internet. We are not interested in you asserting your set of values, beliefs and agendas over yet another free form of information exchange and commerce. Federal regulators and non-elected bureaucrats were never supposed to control and regulate communication and information exchange. Nowhere in the US Constitution are they given any authority to control or regulate free speech, free enterprise or free information exchange. In fact, it actually sets forth prohibitions against this. Freedom is the choice of making good or bad decisions, it's messy. It's not supposed to be controlled or molded by our government or its unelected regulators. Small to large businesses are already suffering and a competitive disadvantage to their international counter parts, because of Washington's insatiable desire to control and regulate everything. Our free enterprise system is continuing to diminish and Socialism is becoming the form of government and economic system which encumbers and defines us.

I oppose the attempt of the FCC and the Obama Administration to regulate the internet and free speech, for the pure and simple reason that they can't control the opposition to their policies and politics. Regulation of the internet will mean the media and the government will no longer have any truly free opinion exchange of an opposing nature. It will hurt American business making us less competitive than we are already. It will hurt and stifle American citizens who disagree with current party or administration in control, regardless of which party it happens to be. Finally it will hurt America by continuing to regulate and restrain free speech and making us less free and less the America we once were.

Fulton Sheen

Furthermore, as a network professional for more than 30 years, I fully understand the implications of removing prioritization from the routers, servers, and other intelligent devices providing orderly traffic to reach its destination. If the FCC passes this legislation, you will hamstring providers, kill millions of jobs in the network infrastructure profession, and create one more grab for control of the private sector. I resent your effort and will do everything in my power to see you not only defeated, but unmasked for the deceit you perpetuate on the citizens of our country!

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I fell very strongly that any attempt to regulate content, or prioritization of the internet is a direct and blatant violation of my freedom of speech, which is protected under the First Amendment of the Constitution.

It is also my belief that government ownership or control of the internet will be the next feeding frenzy for powerful lobby groups.

Respectfully submitted,

Donna Shively

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I agree with the members of Americans for Prosperity.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In summary...the government should leave the internet alone. Just look at all the other government run institutions that are broke already and have been for years... The US Post Office, Social Security, Fannie Mae, War On Poverty, Medicare and Medicaid, Freddie Mac, Cash for Clunkers...all a 100% failure rate

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Everything government regulates suffers from unintelligent and uncaring oversight that adds cost and slows innovation. The Net is conversation between citizens, the government has no right to listen in or regulate that intercourse.

To put it plainly, if it isn't broke, don't fix it. The Internet has flourished in private sector hands; if that changes, Congress can decide what to do about it. At the moment, "net neutrality" is entirely unnecessary.

I agree with the comments provided below from Americans for Prosperity, but also wanted to add my statement.

This "Open Internet" concept which promotes, "Together we can preserve a 'free' and 'open' Internet to promote greater innovation, job creation, and a more connected America" will do nothing more than stagnate free speech and competition on the web. Don't ruin a good thing by allowing government regulations (of any kind) to deter companies and individuals from enjoying an already "free" and "open" Internet. I can guarantee, companies and individuals, like myself, will stop using the Internet. You will drive away competition, therefore companies and the people they employ, and an otherwise "booming" Internet community that was already innovative (and growing).

Furthermore, I support the following:

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please keep Governmental hands and regulations off the internet!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive and such competition keeps companies honest in its internet services. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers and go out of business. If the government exercised control over the Internet, and its actions were malicious in blocking or censoring specific Internet traffic, there would be no place to turn for recourse.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense. The net effect would be to drive out for profit competition, exactly what is needed to keep companies honest.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that must be debated in Congress, the legitimately elected legislative branch of government. The Commission must not on its own set into motion regulatory changes that will force us down this path. The legality of attempts to do so will surely be challenged.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior (if they have it let's have it presented in open forum), there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

America was founded on Christian principles and the free enterprise concept of capitalism with minimal government intervention and control.

All that is being challenged today and we should oppose it and expect our duly elected representatives in Washington to defeat any proposed law that violates these founding principles. Prayer should be encouraged in our schools and attempts by the ACLU to do otherwise should be slammed down quickly. The American flag should be given the respect it should have. Government control of business should be kept at a very minimum to protect American lives and well being. The use of the Internet should be privately owned and competitively run. The government should not impose its control under any disguise such as Open Internet.

Lawmakers who do not support the ideas and principles of the Founding Fathers should be voted out of office. Give us back the America as it used to be.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. This is simply one more example of how our communist leadership is grabbing control. If they can limit discussion and communication, they control the debate and win.

The only reason you people want to do this is because you can't stand having the light of truth beamed upon your Marxist propaganda. If the web was chock full of support for the socialist BS you keep shoveling out of DC, you wouldn't be saying 'BOO' about internet freedom.

Unfortunately for you, the web hasn't been as sickeningly malleable as the press - all of whom can't suck down to the leftwing idiocy fast or often enough - and hence, we who love our country have become a primary danger to those of you who don't.

Hands off our internet. Move to some socialist paradise in Europe where you belong and leave what remains of our noble Constitution and our beautiful Republic ALONE.

Sue Speck & Igor Jaworowsky

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Keep the federal government out of our personal lives.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I have been in the telecom & internet industry for years, and have personally experienced the benefit of competition: lower prices and better service. Where, pray tell my dear Chicken Littles, is the problem exactly?

The government's role in communications issues should be one of minimally intrusive, common sense, rules that allow all competing interests equal access and a level playing field. How successfully each of those competitors operates on that level playing field should be market-driven. If what they are doing is not in the best interest of a consumer, they will have alternative means to accomplish their task or need and the abuser will be flushed from the market through free choice, not government manipulation.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please stop now!

As an Americans for Prosperity tax payer, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I will submit the official response below, but first my personal response:

As a private citizen and as a professional I will tell you now, I will NEVER accept government control of the free enterprise known as the internet. This dangerous path to socialism will not be accepted by me or any other true American - EVER! You need to back off of this ridiculous nonsense right now. Knowing the technical requirements to create and maintain such complex networks myself, it is quite obvious to me that the morons who thought this ill conceived idea up have absolutely no clue in how things work. Not to mention the governments great legacy of "achievements" when it puts it's nose where it does not belong. Enough - drop this BS right now.

NOW THE OFFICIAL COMMENT:

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In a nutshell, keep the government away from regulating legitimate Internet usage and models.

Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I watch what is taking place in Iran and notice a grave similarity to what you wish to do. Control the media - including the internet in order to censor what people are allowed to hear. To promote liberal points of view and try to change our country into a close version of France. Think of yourself as an American first and you have to realize how wrong your thinking is. We are a great country and will only continue to succeed if we retain our freedom.

I, and I now realize, many other Americans are not willing to allow the take over of our lives by a government running out of control with power.

Transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress not decided by a Commission.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

If you continue along the path that you are chosen you will lose the faith of taxpaying Americans and you should prepare yourselves for what will happen at that point in time.

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

FOREST, Virginia 24551

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. For the government to even contemplate trying to control free access to the internet is a direct assault on freedom of speech and put said government in the same league as the people's republic of china. No amount of rationalization can put a good face on such an outrageous proposal! The attempt to become a controlling presence in all areas of ordinary life is not in keeping with concept and content of the Constitution.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

What you are trying to do is ultimately silent dissent and control all media outlets as dictators such as Hugo Chavez do, and as the Soviets did. No more trampling on our constitution.

Private industry is the economic engine that runs a stable economy. Government controlled internet is unconstitutional at its core and will surely be met with intense and highly expensive legal opposition. The final outcome of course, is a definitive loss for the FCC.

There is too much government control for a party in power that has been so critical in the past of others in power who were branded as restricting the people's freedoms. This is especially dangerous as much of this is being done w/out using the proper avenues of good government. Too much and too fast.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The Internet should remain open and without government restrictions of any kind! Many businesses rely on the Internet to do business. Government involvement and intervention would only serve to further limit the growth of a free market. Please vote to keep government regulations and bureaucrats away from the Internet.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. 1944 N. Stanton Court  
Arlington Heights, Illinois 60004

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Simply said, private businesses that build private networks to connect to the Internet should be able to make their own decisions regarding how to manage those connections.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

GN Docket No, 09-191, WC Docket No. 07-52:

Everything you are talking about has not happened and will not happen as long as the internet stays as much government free as possible. It will only become that way if the government gets involved and then creates monopolies. I say leave the internet alone in it's current form. It concerns me to see the government wanting to take over something that works totally fine in it's current capitalistic form. Freedom makes our country great, not regulation.

Still don't see the purpose behind this at all? What the video said made no sense what so ever. Keep the internet free please.

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Do not mess with the Internet. It is now the most free means of speech available to you and to me. Government regulation is not needed. It is highly competitive. It is also highly responsive to customers and their demands. I oppose government control.

With control or regulation by government, control over content will follow. That is unacceptable.

I became a citizen because of my love of the freedoms guaranteed by the Constitution. Do not mess with this freedom. You may think you are enhancing the freedom or even expanding it. Your proposed actions will eventually reduce it.

It works now. "It aint broke". Don't break it in the name of fixing it.

You may not like the content of many sites for social, political, religious , or other reasons. That is fine. I do not either. But by using the vast powers of the government and regulators to tax, set policy, and restrict content is unacceptable. It is unacceptable for you as a regulator to try to take the freedom of it away. Drop the idea.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

This too is unacceptable.

The Internet flourished as an open market and with little regulation. Now that it is a huge success, Washington is trying to determine how they can insert their heavy hand and gain fees from it's use. Keep your hands off the Internet. It's been more than fine without you mucking things up.

In addition:

Looks to this writer that this is a matter of freedom of expression just the same as speaking freely about what's on our mind. Such action as being considered is clearly not constitutional in my opinion.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The internet is an open forum that is available to everyone world wide - a true freedom for all. Regulation or control of the internet by any governmental entity is neither necessary nor desired except that it may be necessary or desired by the government to control and suppress dissent. There can be no ethical or moral justification for controlling or suppressing dissent or free speech. Our founding fathers warned us against allowing our government such power. I stand with them. Leave the internet open.

Do you people want to kill the only thing left in this country that is still creating jobs? Manufacturing, production, etc. have all been destroyed and there is no indication any of these things are ever coming back. Most jobs have been moved off-shore and if you take the internet we will turn into a third world country. I realize that is what obama and his cohorts want but we, the American People, are not going to let that happen. If necessary you will see another revolution similar to 1775. Leave the internet alone!!!

Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Increased involvement by elected or appointed government officials in the internet arena can only worsen this vital resource. Please leave it competitive and free, or, if it isn't broken, don't fix it!

Bill Vick

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. With regards to an open internet please consider the following comments made by me, a patriot: GN Docket No, 09-191, WC Docket No. 07-52:

Government imposed regulations and taxes on telephone services has made it an expensive and often times a cumbersome, unreliable means of communication and information. But, that is certainly not a surprise. You cannot name one service that is run efficiently by government when compared to the same service run by a private entity. The sheeple of this country will soon learn that with the socialized healthcare being forced upon them by a government that is NOT responsive to the needs and desires of the citizens it is to be serving. Capitalism works and works far better than the socialistic and communistic forms of government that are being thrust upon us by our politicians and their moronic, electorate that produces nothing and only lives on the public dole. However, Capitalism only works when government does NOT interfere. This has been proven over the last 234 years in this country. From 1776 through 1912 capitalism had escalated the United States to the position of the country with the highest standard of living in the world, while having NO debt. How was this accomplished? Simple, the damn government kept it's thieving hands out of the workings of capitalism. Then in 1913 the federal government (aka thieves) instituted the Federal Reserve and income tax. These undermined capitalism two ways. 1) Diluted the sovereignty status of this once illustrious nation by forfeiting the control of it's currency, in large part, to other countries through the federal reserve. 2) Financing the advancement of socialism and communism through the income tax. Since 1913 taxation has gradually increased to it's current obscene amount, and it's still escalating. The taxation is financing organizations such as labor unions and ACORN, and to buy controlling interest in railroad, banking, and automotive industries. Hell, tax dollars are even given to U.S. companies that build manufacturing plants in foreign countries. This serves only to tear down private enterprise, and to enslave the people of this country.

The internet works very well in it's current state. People get information quickly, people and companies make money, and pleasure is obtained through the internet. MEMBERS OF GOVERNMENT (AKA THIEVES) KEEP YOUR DAMN HANDS OUT OF THE INTERNET.

We are submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet should not be crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should only be achieved by a majority vote of the people of the U. S. The Commission should not on its own set into motion arbitrary regulatory changes that will force the people that use the internet down another unpopular bureaucratic maze of control and regulation.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This is nothing short of more restrictive bureaucratic government control and regulation in an area that should be left solely to the voice of the qualified voters of the U. S.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of illegal anti-competitive behavior, there is simply no rationale for imposing any new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Every Oppressive Government on earth today has started by contolling the Internet. This Administration risks sparking another true American Revolution which sweeps most of Congress and the Executive Branch into historical ignominy .

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

The following argument can be made in generalized form against any command and control rules enacted by regulatory agencies/bureaucracies without discussion and position taking by our legislation and executive branches. The legislative branch should not cede its responsibility of crafting the laws and regulations that guide the lives of their constituents.

Specifically:

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I do not want the Govenment taking over the internet by misleading us into thinking it is for the good of all of us. It is NOT! It is an infringement upon our right to Freedom of Speech! This is a right given to us as documented in the US Constitution! Apparently you have not read the Constitution for some time - please do - and while you are at it - please find the authority in there to force Americans to buy healthcare plans. YOU WON'T FIND IT!!!  
PLEASE START DOING WHAT YOU TOOK AN OATH TO DO - UPHOLDING THE US CONSTITUTION - START THERE - THEN WE CAN DISCUSS OTHER ISSUES!

The bill of rights guarantees freedom of speech. Government control of the internet severely hinders this freedom and would be unconstitutional. The government has far too much control over us already and is operating way outside of the bounds anticipated by the founding fathers of this great nation. Power corrupts and absolute power corrupts absolutely. If you want to regulate something, regulate the removal of the kiddie porn, terrorist plots, and other illegal activity. Until you get that right, leave the rest alone.

The government has no business regulating the internet and we would appreciate it if you would keep your hands off it. I for one am sick and tired of the federal government's agenda to stifle free speech at every turn be it on the radio, TV or on the internet. The Constitution may be a piece of trash to you but it is sacred to us and we're fed up with your dismantling it at every turn.

Our internet has worked very well without government intrusion for all these years; there is absolutely no reason to change the pattern now. Enough is enough . . . do not infringe on the freedom of the internet. We don't appreciate your trying to destroy our liberties and we're not going to sit idly by and watch any more disappear.

In short, HANDS OFF!

Government control is going beyond what our fore-fathers built this country on, what happened to America land of the free? How many more restrictions do we have to withstand because of government? Will the restrictions apply to those in government? Like the rest of their rules and restrictions, probably not. Can government STOP taxing the people?

Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

\*\*\*\*\*

If in fact you pass this, I will stop using the internet and do everything in my power to get as many people as possible to do the same. I am 100% against this and so is everyone else I mention it to. I am as well as most Americans and people on this planet AGAINST GOVERNMENT CONTROL OVER ANYTHING. Living without the internet (which I use every day mind you) will not be hard to do if you pull this controlling stunt.

Dear Reader, Please consider the following. As an American for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

We are submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

We are opposed to the proposed rulemaking for the following reasons: The proposed burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

We are especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Moreover, restrictions on internet content is a violation of my Constitutional rights to FREE speech. For this reason any restrictions, including such restrictions now being contemplated, are therefore unconstitutional, whoever places such restrictions on the public's right to free speech.

Re: GN Docket No, 09-191, WC Docket No. 07-52:

I am against the proposed "Open Internet" changes because they violate the First Amendment of the Constitution. I appreciate your hard work, but recognize that you were appointed, not elected, and have no authority to radically change the Internet. If the Founders had wanted appointed Commissions and Departments to make significant decisions about American life, they would have put that in the Constitution. The Constitution also states that powers not given to the Federal government belong to the states or to the citizens, except to aid the "general welfare." The proposal does not help all Americans generally, but helps some and hurts others.

Thank you.

As an interested American, I am submitting the following comment regarding the matter of preserving the Internet as it stands today. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The "burden of proof" standard for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

Leave The Internet alone. We don't need anyone in Washington telling us how The Internet should operate. There should never be any government money involved in the internet. The "public utility" model is unnecessary intrusion into something that is not broken. The U.S. government should leave it alone. There are too many other things that could use the focus.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please, leave The Internet alone!

With the clear and present danger of government preventing release of information adverse to its own interests the FCC has no business even suggesting any control of the internet. All one has to do is look at the fraud that is the climategate which is a case study in government cover-up of adverse information to its interest in control.

More government means less freedom. Keep your hands off the internet.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52: Keep your mitts off the internet.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I oppose the proposed intrusive regulation of the internet contained in the docket, "In the Matter of Preserving the Open Internet". My family has used several different internet service providers in the past fifteen years, and we are pleased with the improvements in service and the broad selection of providers which have developed in that time. We do not see evidence that ISP's are abusing the public in any manner which would justify FCC intervention.

Please devote your time and attention to matters more worthy of them.

Yours truly,  
Richard White  
Phoenix, AZ

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn to assure free speech and open discussions.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent utilization of business models that may be economically efficient. This will impose personal uncertainty and create huge litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government censorship/ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government and approved by a majority of the American voters. The Commission should not on its own set into motion regulatory changes that will force us down this path to censorship and further reductions of our constitutional rights.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted and scrutinized. In the absence of verifiable, concrete evidence of any discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The Internet has become the greatest tool of freedom in the last 100 years. It should be allowed to grow and spread freedom and enlightenment worldwide.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is a highly competitive open medium. As such it has greatly impacted the monopoly of newspapers and traditional TV news to control the information flow to US citizens by opening free speech to a level not available since our founding fathers brandished their "illegal" presses during the times preceding the American Revolution. Now we are entering into a time where the open internet is allowing competition with the traditional "phone" and traditional "cable" companies. This is American capitalism at the purest. The combination of these elements are behind the drive to "control the internet as it is the one media that no one has control of.

"Net Neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. There is no concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations other than the .

What made the internet the force it is today was the determination and dedication of the "little guy" - people all over the world dedicated to making it happen. And it happened with little or no governmental interference. Let's keep government out of the internet as much as we possibly can. In so doing, we will preserve what the "little guy" has so ingeniously created.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Carroll Williams

Northampton, Pennsylvania 18067

I am an every-day user of the Internet. I use to communicate with relatives, friends, fellow retirees and business associates. I DON'T want government sticking their nose in the public domain. The Internet has operated well enough without Big Brother (FCC) breathing down our throats. We don't need any more big government.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

To me this is just another invasion of our privacy and our rights to free speech. The only reason they are wanting to do this is so we as Americans can't communicate to each other and keep things moving in America. I'm highly opposed to Government intervening with the internet.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The American people WILL NOT live in a socialist country where the government controls everything including internet. NO NET NEUTRALITY. Cease and desist immediately!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

If the government took control of the internet that would be just one more step towards a socialist society. It seems to me that the democrats are slowly trying to control every aspect of our lives. If the "open Internet" proposal goes through, the next government take over will be TV and/or radio. The internet is currently the only medium that someone such as myself with no media connections to vent my political strife. If the government takes over what would stop them from silencing my my and other's words?

Long Live the First Ammendment!!!

I would personally like to add that like anything else in society, there lies the potential for good and evil uses of this mode of communication. As a citizen, I am advocating for the freedom to choose which of that particular content I wish to view or transmit and do not wish to have this freedom replaced with the federal governments idea of what I should be allowed to view or transmit. I have a moral standard of what should be allowed for me based not on my opinion, but on the moral standard found in the Bible. If the government was to make that decision for me, who decides the standard allowed, and what would they base that opinion on?

A poll? Because today's governmental moral standard would not be fixed and unchangeable, like the Bible's, the potential for abuse would be far too great to risk.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Stay out our lives. The web does not belong to the government!!!!

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

As a public minded citizen, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. On the other hand, I would appreciate a provider that censors lots of stuff to protect me from predators of various stripes.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically or socially efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so long that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down or even stifling the lightly regulated, competitive Internet.

The last thing we need is some czar who, like most other czars, knows nothing about her/his area of responsibility. Do not model our internet after China's.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Keep the internet as a free form of communication. The government and its many agencies have intruded into too many parts of our lives already. The stupidity must stop. Stop stepping on our freedoms or eventually pay for your actions.

KEEP GOVERNMENT HANDS OFF THE INTERNET!!! I, as an individual American, AM VERY PLEASED with the current PRIVATELY BUILT AND MAINTAINED Internet! The Proposed Government regulations would DESTROY THE INTERNET.

KEEP YOUR HANDS OFF!!!
